Poor construction practices lead to environmental contamination

Remember:

- When cutting or drilling AZEK-TREX or any plastic poly-compound materials, use a vacuum attachment on all saws when practical.
- Cut and drill in confined spaces to keep dust down to a minimum and ease of cleanup.
- Never cut or drill without a tarp under power tools.
- Clean the area as often as possible.
- Never leave the site without cleaning up plastic contaminants.
- DO NOT blow your debris into the storm drains. That just washes them into our water systems for contamination that lasts thousands of years.

Keep the Plastics and contaminants out of the ocean, bays and wetlands

Once created, **plastic will stay around for hundreds – or even thousands – of years**, in which time it can pollute and poison environments and the animals that inhabit them.

We all have a responsibility to protect our shores!
